This publication is protected by federal regulation and shall not be copied, distributed, transmitted, transcribed or translated into any human or computer language, in any form or by any means, to any third parties, without the express written consent of Eclipse, Inc.

In accordance with the manufacturer’s policy of continual product improvement, the product presented in this brochure is subject to change without notice or obligation.

Disclaimer Notice

The material in this manual is believed adequate for the intended use of the product. If the product is used for purposes other than those specified herein, confirmation of validity and suitability must be obtained. Eclipse warrants that the product itself does not infringe upon any United States patents. No further warranty is expressed or implied.

We have made every effort to make this manual as accurate and complete as possible. Should you find errors or omissions, please bring them to our attention so that we may correct them. In this way we hope to improve our product documentation for the benefit of our customers. Please send your corrections and comments to our Marketing Communications Manager.

Liability and Warranty

It must be understood that Eclipse’s liability for its product, whether due to breach of warranty, negligence, strict liability, or otherwise is limited to the furnishing of replacement parts and Eclipse will not be liable for any other injury, loss, damage or expenses, whether direct or consequential, including but not limited to loss of use, income, or damage to material arising in connection with the sale, installation, use of, inability to use, or the repair or replacement of Eclipse’s products.

Any operation expressly prohibited in this Guide, any adjustment, or assembly procedures not recommended or authorized in these instructions shall void the warranty.
About this manual

AUDIENCE
This manual has been written for people who are already familiar with all aspects of a nozzle-mix burner and its add-on components, also referred to as “the burner system.”

These aspects are:
• Design/selection
• Use
• Maintenance.

The audience is expected to have had experience with this kind of equipment.

THERMJet DOCUMENTS
Design Guide No. 206
• This document

Data Sheet No. 206-1 through 206-13
• Available for individual TJPCA models
• Required to complete design calculations in this guide

Installation Guide No. 206
• Used with Data Sheet to complete installation

RELATED DOCUMENTS
• EFE 825 (Combustion Engineering Guide)
• Eclipse bulletins and Info Guides: 610, 710, 720, 730, 742, 744, 760, 930

Purpose
The purpose of this manual is to make sure that the design of a safe, effective and trouble-free combustion system is carried out.
Document Conventions

There are several special symbols in this document. You must know their meaning and importance.

The explanation of these symbols follows below. Please read it thoroughly.

Danger:
Indicates hazards or unsafe practices which WILL result in severe personal injury or even death.

Only qualified and well trained personnel are allowed to carry out these instructions or procedures.

Act with great care and follow the instructions.

Warning:
Indicates hazards or unsafe practices which could result in severe personal injury or damage.

Act with great care and follow the instructions.

Caution:
Indicates hazards or unsafe practices which could result in damage to the machine or minor personal injury, act carefully.

Note:
Indicates an important part of the text. Read thoroughly.

How to Get Help

If you need help, contact your local Eclipse representative.

The ThermJet PCA (preheated combustion air) is a nozzle-mix burner designed to fire an intense stream of hot gases through a combustor using preheated combustion air temperatures up to 1000° F. (Models TJPCA0500 through TJPCA1000 are rated for use with preheated combustion air temperatures up to 700° F.)

The high velocity of the gases improves temperature uniformity, product quality and system efficiency. ThermJet PCA burners use medium velocity TJ combustors providing velocities from 250 ft/s to 750 ft/s depending on the temperature of the preheated combustion air.
Important notices about safe burner operation will be found in this section. Read this entire manual before attempting to start the system. If any part of the information in this manual is not understood, then contact your local Eclipse representative or Eclipse before continuing.

**Danger:**
The burners covered in this manual are designed to mix fuel with air and burn the resulting mixture. All fuel burning devices are capable of producing fires and explosions when improperly applied, installed, adjusted, controlled or maintained.

Do not bypass any safety feature. Fires and explosions can be caused.

Never try to light the burner if the burner shows signs of damage or malfunctioning.

**Warning:**
The burner is likely to have HOT surfaces. Always wear protective clothing when approaching the burner.

**Note:**
This manual gives information for the use of these burners for their specific design purpose. Do not deviate from any instructions or application limits in this manual without written advice from Eclipse.
Warning:
Eclipse products are designed to minimize the use of materials that contain crystalline silica. Examples of these chemicals are: respirable crystalline silica from bricks, cement or other masonry products and respirable refractory ceramic fibers from insulating blankets, boards, or gaskets. Despite these efforts, dust created by sanding, sawing, grinding, cutting, and other construction activities could release crystalline silica. Crystalline silica is known to cause cancer, and health risks from the exposure to these chemicals vary depending on the frequency and length of exposure to these chemicals. To reduce this risk, limit exposure to these chemicals, work in a well-ventilated area and wear approved personal protective safety equipment for these chemicals.

Adjustment, maintenance and troubleshooting of the mechanical and the electrical parts of this system should be done by qualified personnel with good mechanical aptitude and experience with combustion equipment.

The best safety precaution is an alert and competent operator. Thoroughly instruct new operators so they demonstrate an adequate understanding of the equipment and its operation. Regular retraining must be scheduled to maintain a high degree of proficiency.

Order replacement parts from Eclipse only. Any customer-supplied valves or switches should carry UL, FM, CSA, CGA and/or CE approval where applicable.
Design structure
Designing a burner system is a straight-forward exercise of combining modules that add up to a reliable and safe system. The design process is divided into the following steps:

1. Burner model selection:
   a. The burner size and quantity
   b. The fuel type and pressure
   c. The combustor material
2. Control methodology
3. Ignition system
4. Flame monitoring system
5. Combustion air system: blower and air pressure switch
6. Main gas shut-off valve train selection
7. Process temperature control system

Burner size and quantity
Select the size and number of burners based on the heat balance. For heat balance calculations, refer to the Combustion Engineering Guide (EFE 825).

Performance data, dimensions and specifications are given for each TJPCA model in Data Sheets 206-1 through 206-13.

Fuel type & fuel pressure
The usable fuel types are:
- Natural gas
- Propane
- Butane

For other fuels less than 800 Btu/ft (330 MJ/m3) contact Eclipse with an accurate breakdown of the fuel contents.

The minimum gas pressure required at the burner can be found in ThermJet PCA Data Sheets 206-1 through 206-13.
**Combustor Material**

The combustor that you choose depends on the temperature and the construction of the furnace. Each burner size comes in at least two materials (SiC is available on models up to 0200TJPCA). Select material suitable for furnace and preheated air temperature.

The application temperature limits of the combustors can be found in ThermJet PCA Data Sheets 206-1 through 206-13.

The control methodology is the basis for the rest of the design process. Once it is known what the system will look like, the components can be selected. The control methodology chosen depends on the type of process to be controlled. All methods employ a heat exchanger and eductor per zone.

**Step 2: Control Methodology**

There are four basic methods for preheated combustion air applications. The methods depend on how furnace pressure control and ratio control are applied:

1. Furnace pressure control fixed at start up. Single diaphragm ratio regulator
2. Furnace pressure control fixed at start up. Double diaphragm ratio regulator

The recommended method to control the input of a ThermJet PCA burner system is modulating gas & air (on-ratio control or excess air @ low fire). This method may be applied to single burner as well as multiple burner systems:

**Note:**
The stated operational characteristics only apply if the described control circuits are followed. Use of different control methods will result in unknown operational performance characteristics. Use the control circuits contained within this section or contact Eclipse for written, approved alternatives.
In the pages that follow you will find schematics of these control methods. The symbols in the schematics are explained in the “Key to System Schematics” (see Appendix).

Automatic gas shut-off by burner or shut-off by zone
The automatic gas shut-off valve can be installed in two operational modes:

1. Automatic gas shut-off by burner
   If the flame monitoring system detects a failure, the gas shut-off valves close the gas supply to the burner that caused the failure.
2. Automatic gas shut-off by zone
   If the flame monitoring system detects a failure, the gas shut-off valves close the gas supply to all the burners in the zone that caused the failure.

Note:
All ThermJet PCA control schematics on the following pages reflect a single gas automatic shut-off valve. Each schematic shows both operational modes. Only one is necessary. This may be changed to conform to local safety and/or insurance requirements (Refer to page 9 of ThermJet Installation Guide No. 206).

Modulating gas & air
On-ratio control or excess air @ low fire
A burner system with modulating control gives an input that is in proportion with the demands of the process. ANY input between high and low fire is possible.

1. Air
   The control valve 1 is in the air line. It can modulate air flow to any position between low and high fire air.
2. Gas
   The ratio regulator 2 allows the on-ratio amount of gas to go to the burner. Low fire gas is limited by the ratio regulator 2. High fire gas is limited by the manual butterfly valve 3.

Note:
The ratio regulator can be biased to give excess air at low fire

Note:
Do not use an adjustable limiting orifice (ALO) as the high fire gas limiting valve 3. ALO’s require too much pressure drop for use in a proportional system.
Step 2: Control Methodology (continued)

Modulating gas & air. On-ratio control or excess air @ low fire

1. Furnace pressure control
   - Single diaphragm ratio regulator
   - Fixed at startup

2. Automatic furnace pressure control
   - Double diaphragm ratio regulator
   - Electronic mass ratio control
Step 3: Ignition System

For the ignition system use:
- 6,000 VAC transformer
- Full-wave spark transformer
- One transformer per burner

DO NOT USE:
- 10,000 VAC transformer
- Twin outlet transformer
- Distributor type transformer
- Half-wave transformer

It is recommended that low fire start be used. However, ThermJet PCA burners are capable of direct spark ignition anywhere within the specified ignition zone (see Data Sheets 206-1 through 206-13).

Note:
You must follow the control circuits described in the previous section, “Control Methodology,” to obtain reliable ignition.
Local safety and insurance require limits on the maximum trial for ignition time. These time limits vary from country to country.

The time it takes for a burner to ignite depends on:
- The distance between the gas shut-off valve and the burner
- The air/gas ratio
- The gas flow at start conditions

It is possible to have the low fire too low to ignite within the trial for ignition period. Under these circumstances you must consider the following options:
- Start at higher input levels.
- Resize and/or relocate the gas controls.
- Use bypass start gas. (See page 14)

Bypass start gas (optional)
A bypass start gas circuit provides gas flow around zone gas control valves during the trial for ignition period. This should only be used if excess air is being used on low fire; it should NOT be used with on-ratio low fire systems. During the trial for ignition period, the solenoid valve in the bypass line plus the automatic gas shut-off valve (either at each burner or each zone) are opened. If a flame is established, the bypass solenoid valve closes at the end of the trial for ignition period. If a flame is not established, then the bypass solenoid valve and the automatic gas shut-off valve close.

(See page 14 for bypass start gas circuit schematic)
Step 4: Flame monitoring system

A flame monitoring system consists of two main parts:
• A flame sensor
• Flame monitoring control

Flame sensor
All ThermJet PCA burners operate with UV Scanners only. A U.V. scanner can be used with all combustor types. You can find information on U.V. scanners in these documents:
• Info Guide 852 for 90° U.V. scanners
• Info Guide 854 for straight U.V. scanners
• Instruction Manual 855 for Solid State UV/IR scanners
• Info Guide 856 for self-check U.V. scanners

Note:
Ambient temperature limits for the scanners are likely to be exceeded. An insulated coupling, heat block seal or scanner cooler may be required. See Bulletins 832 and 834.

Flame Monitoring Control
The flame monitoring control is the equipment that processes the signal from the U.V. scanner.

For flame monitoring control you may select several options:
• Flame monitoring control for each burner: if one burner goes down, only that burner will be shut off
• Multiple burner flame monitoring control: if one burner goes down, all burners will be shut off

There are three recommended flame monitoring controls:
• Bi-flame series; see Instruction Manual 826
• Multi-flame series 6000; see Instruction Manual 820
• Veri-flame; see Instruction Manual 818

Other manufacturer’s flame monitoring systems can be used with the burner if spark is maintained for a fixed time interval and is not interrupted when a flame signal is detected during trial for ignition.
Effects of atmospheric conditions

The blower data is based on the International Standard Atmosphere (ISA) at Mean Sea Level (MSL), which means that it is valid for:

- Sea level
- 29.92” Hg (1,013 mbar)
- 70°F (21°C)

The make-up of the air is different above sea level or in a hot area. The density of the air decreases, and as a result, the outlet pressure and the flow of the blower decrease. An accurate description of these effects is in the Eclipse Combustion Engineering Guide (EFE 825). The Guide contains tables to calculate the effect of pressure, altitude and temperature on air.

Blower

The rating of the blower must match the system requirements. You can find all the blower data in Bulletin/Info Guide 610.

Follow these steps:

1. Calculate the outlet pressure.

   Note:

   For a given combustion air flow, system pressure drops increase with air temperature. Multiply calculated cold air pressure drops by the appropriate factor in the chart at left to arrive at the preheated air drop.

When calculating the outlet pressure of the blower, the total of these pressures must be calculated.

- The static air pressure required at the burner found in the burner Data Sheet, 206-1 to 206-13
- The total pressure drop in the piping
- The total of the pressure drops across the valves
- The pressure in the chamber (suction or pressurized)

Eclipse recommends a minimum safety margin of 10%

2. Calculate the required flow

   The blower output is the air flow delivered under standard atmospheric conditions. It must be enough to feed all the burners in the system at high fire and provide the eductor flow.

   Combustion air blowers are normally rated in terms of standard cubic feet per hour (scfh) of air.

   An example calculation follows the information tables.
Step 5: Combustion Air System: Blower and air pressure switch (continued)

### Example Blower Calculation

#### Application example:
A batch furnace requires a gross heat input of 2,900,000 btu/hr. (based on anticipated 60% efficiency with preheated air). The designer decides to provide the required heat input with four burners operating on natural gas using 15% excess air.

#### Calculation example:

<table>
<thead>
<tr>
<th>Step</th>
<th>Calculation</th>
</tr>
</thead>
</table>
| a.   | Decide which ThermJet PCA burner model is appropriate:  
\[
\frac{Q}{4 \text{ burners}} = \frac{2,900,000 \text{ btu/hr}}{4} = 725,000 \text{ Btu/hr/burner}
\]  
- Select 4 Model TJ0075 ThermJet PCA burners based on the required heat input of 725,000 Btu/hr for each burner.  
| b.   | Calculate required gas flow:  
\[
V_{gas} = \frac{Q}{q} = \frac{2,900,000 \text{ btu/hr}}{1,002 \text{ Btu/ft}^3} = 2,894 \text{ ft}^3/\text{hr}
\]  
- Gas flow of 2,894 ft³/hr is required

<td>30.47</td>
<td>3.225</td>
</tr>
</tbody>
</table>

* Stoichiometric: No excess air. The precise amount of air and gas are present for complete combustion.
Calculation example (Continued):

c. Calculate required stoichiometric air flow:

\[ V_{\text{air-Stoichiometric}} = \alpha (\text{air/gas ratio}) \times V_{\text{gas}} = 9.41 \times 2,894 \text{ ft}^3/\text{hr} \]
\[ = 27,235 \text{ ft}^3/\text{hr} \]

• Stoichiometric air flow of 27,235 scfh required

d. Calculate blower air flow requirement based on the desired amount of excess air:

\[ V_{\text{air}} = (1 + \text{excess air } \%) \times V_{\text{air-Stoichiometric}} \]
\[ = (1 + 0.15) \times 27,235 \text{ ft}^3/\text{hr} = 31,320 \text{ ft}^3/\text{hr} \]

e. Calculate eductor flow. For this example, eductor flow is 40% of combustion air flow:

\[ V_{\text{eductor}} = 0.4 \times 31,320 \text{ ft}^3/\text{hr} = 12,528 \text{ ft}^3/\text{hr} \]

• Final blower air flow requirement is the sum of

\[ V_{\text{air}} + V_{\text{eductor}} = 43,848 \text{ ft}^3/\text{hr} \text{ at 15% excess air.} \]

Note: It is common practice to add an additional 10% to the final blower air flow requirement as a safety margin.

2. Find the blower model number and motor horsepower (hp).

With the output pressure and the specific flow, you can find the blower catalog number and the motor hp in Bulletin/Info Guide 610.

4. Eclipse Combustion recommends that you select a Totally Enclosed Fan Cooled (TEFC) motor.

5. Select the other parameters:

• inlet filter or inlet grille
• inlet size (frame size)
• voltage, number of phases, frequency
• blower outlet location, and rotation direction Clockwise (CW) or Counter Clockwise (CCW).
**Step 5:** Combustion Air System: Blower and air pressure switch (continued)

![Inlet filter with replaceable filter element](image)

**Note:**
The use of an inlet air filter is strongly recommended. The system will perform longer and the settings will be more stable.

**Note:**
When selecting a 60 Hz Blower for use on 50 Hz, a pressure and capacity calculation is required. See Eclipse Combustion Engineering Guide (EFE 825).

The total selection information you should now have:
- Blower model number
- Motor hp
- Motor enclosure (TEFC)
- Voltage, number of phases, frequency
- Rotation direction (CW or CCW).

**Air pressure switch**
The air pressure switch gives a signal to the monitoring system when there is not enough air pressure from the blower.

You can find more information on pressure switches in Blower Bulletin 610

**Warning:**
Eclipse supports NFPA regulations, which require the use of an air pressure switch in conjunction with other safety components, as a minimum standard for main gas safety shut-off systems.

**Consult Eclipse**
Eclipse can help you design and obtain a main gas shut-off valve train that complies with the current safety standards.

The shut-off valve train must comply with all the local safety standards set by the authorities that have jurisdiction.

For details, please contact your local Eclipse representative or the Eclipse factory.

**Note**
Eclipse supports NFPA regulations (two shut-off valves) as a minimum standard for main gas safety shut-off systems.

**Step 6:** Main gas shut-off valve train

![Main gas shut-off valve train](image)

**Step 7:** Process Temperature Control System

**Consult Eclipse**
The process temperature control system is used to control and monitor the temperature of the system. There is a wide variety of control and measuring equipment available.

For details, please contact your local Eclipse representative or the Eclipse factory.
